How do i transfer data from my old pc

There's nothing more exciting than getting a powerful new PC that lets you zip through tasks, launch new apps and play games at an astonishing rate. However, there is nothing frightening about realizing that you have to move all your music, pictures, documents and other files from your old computer to your new computer. Fortunately, you don't have to be able to bribe your friends to help you on this moving day. There are a number of ways to easily and securely share files, and even to move programs from your old computer to a new one while keeping data. DIY access: Manual file transfer If you are a hands-on variety, one of the easiest ways to load your new computer with all your files is to manually move them. There are several ways to do this. For starters, plug your old computer into a USB flash drive or external hard drive, which can typically cost from \$30 to several hundred dollars, depending on the amount of storage, speed and functionality you need. Simply copy files to an external drive, eject the storage device, plug the storage device into the new computer, and then turn the file loading process on it. Tip: Some computers have eSATA ports that are specifically designed for external hard drives and move data even faster than a USB port. If you don't want to buy an external hard drive, you can move and store files in the cloud—using an online storage service like Microsoft OneDrive*, Google Drive*, or Dropbox*. Again, just drop and drag files from your old computer to a cloud service, and then drag and drop the files on your new computer. These services are often free for a small amount of storage, and then charge for a monthly subscription as your storage needs increase. Speed Things Along: Use a transfer cable If using cloud storage can be a time lag or if you want to avoid a monthly subscription to cloud services, an alternative option is to move files with a transfer cable. The cable plugs into the port on the new computer and the old computer. Typically, cables come with software that automates file transfer when upgrading from an older Windows* 10, 8.1, 8, 7, Vista, or XP computer to a newer computer. The transmission cable works faster than the external hard drive, since the old computer connects directly to the new one while eliminating the intermediary (external drive). Before you start transmitting everything, consider whether you really need all that. Setting up a brand new machine marks the ideal moment to discard old files by archiving them, thereby cleaning up your files and folder structures. Jill Duffy, PC Magazine Hire a (PC) Mover: Use Do-It-All Software Earlier versions of Windows provided a service called Easy Transfer* that allowed users to easily move files between computers. Unfortunately, this is written off with Windows* 10. However, fear not: Microsoft has partnered with Laplink PC Mover* to functionally offered Easy Transfer. The vendor's PC Mover Express* transfers data and settings from a Windows* XP-based computer to computers running Windows* 8.1 or later. The service costs about \$15. PC Mover Professional costs more, but also allows you to move your apps. If you have problems, both services offer 24-7 help. This approach requires compensation, but it automates processes and can guide you to make sure you don't overlook files that might be placed in an undisclosed location on your old computer. Sundry Operating Systems: Transfer files from Mac to PC or PC to Mac You can manually transfer files between your Mac and your computer the same way you move them between computers running external drives, cloud services, or home networks. Or you can let only the computer do the job of personal assistant in charge of moving and sharing files: Mac OS X Lion and the later operating system provides a nifty tool called Migration Assistant that transfers your contacts, calendars, email accounts, and more from your computer and puts those files in the appropriate places on your new Mac. : Keep your old data out of the wrong hands Once you move the files, you should keep your old computer for at least a few weeks in case you overlooked any file. However, if you sell, discard, or ode to your old computer, make sure that all your data and personal information is removed. Simply transferring files does not do this. Even deleting files or reformatting a disk can still allow experts to get information you don't want them to have, such as bank details or old emails. Fortunately, free data-destroying programs, such as Dark's Boot And Nuke (DBAN), can delete everything on your old computer, ensuring you don't leave (data) a clue behind. Stay protected: Back up new things Now that you're used to moving files from your old computer, it's a good time to make sure you have a backup system in progress in case you need to restore those files again. Windows* 8 and more provides a handy feature called File History that allows you to automatically and routinely submit file support to an external hard drive. This feature ensures that your data will not be history if the worst happens. If you own a Mac, you have a variety of choices and platforms to back up your data, from iCloud to programs like Time Machine, depending on the version of OS X you're using. Remember: While there are many easy ways to navigate and share data, you can only move data that you can access, so make sure your documents, photos, and other valuable data are protected even if your computer gets lost or damaged. This is easy to do automatically and ensures that your next (computer) day of movement will go smoothly. By Andy Rathbone You can upload files yourself if you are moving from the system 7, 8, 8.1 or 10 PC. You can do this by combining your Microsoft account with your built-in Windows file history backup program. Tell the program to unarchive its old computer files and you will tell the program of the new computer to restore the files. However, you need a portable hard drive to make it work. Portable hard drives are quite cheap, usually costing less than \$ 100. But there's a bonus: When you upload files, the drive works perfectly for security payments for your new computer. To transfer files from an old Computer running Windows 7, 8, 8.1, or 10 to a new Windows 10-based computer, follow these steps: If you have Windows 7 on your old computer, upgrade it to Windows 10.Za many Windows 7 owners it's probably a deal breaker. Unless, of course, you took advantage of the free Windows 10 upgrade offer that ended on October 29, 2015, you're going to have to do something about it. Now that the deadline has passed, Windows 7 owners may be better off buying file transfer programs. If you have Windows 8, 8.1, or 10 on your old PC, go to step 2. If you've already used File History on your old computer, jump to step 5. Otherwise move to step 3. Sign in with your Microsoft account on your old PC. When you sign in to your Microsoft account, Microsoft remembers many of your settings and services so that it can duplicate them on other computers that you sign in to. Plug the portable hard drive into your old computer, and then set file history to save the files to your portable hard drive. File history is embedded in windows 8, 8.1, and 10. It could take anywhere from a few minutes to a few hours to back up your files for the first time. While file history supports your files, displays the File History statement for the first time that keeps copies of files. (It also lists the word Stop in case you want to stop the backup.) When file history completes the file backup to the portable drive, those words change to say The files were last copied, followed by the date and time when the file backup ended, as shown. At that point, go to step 5. The File History window lists the date and time of the backup. Sign in to your new Windows 10 pc with the same Microsoft account you used on your old computer. Then plug the portable hard drive into the new computer. By signing in to your Microsoft account, the settings are automatically transferred to your new computer. (The background on the new computer changes quickly to fit your old computer, letting you know something is up.) Open File History and point your new Windows 10 PC towards an old file history backup. On your new Windows 10 PC, click the Start button and type File History in the Search box, and then press Enter. As shown, the control panel file history window appears. Select the backup you want to restore. Click the check box labeled I Want to Use a Previous Backup on this file history drive. The window falls, specifying the backup you made old computer. Click his name and click the Turn on button button. Your new computer is starting to back up your files for the first time, but these incoming files won't damage your old computer's backup. Choose Restore Personal Files from the left pane of the File History window. Select files and folders to restore, and then select green Restore button. Click the Back or Back arrows next to the large green button along the bottom of the window until you find the date and time of the files you want to restore. For example, if you first used File History on your old computer in step 4, click the Back arrow (left) until you back up number 1. If you've been using file history on your old PC all along, click the Forward arrow (to the right) to move to the latest backup. When viewing the files or folders you want to restore, click the green button located at the bottom edge of the window, shown here. File history begins copying files and folders of your old computer to your new computer. Click the green button to restore files and folders. If there are no complications, your new computer should soon have files and folders from your old computer. If you've already used File History on your old computer, all old computer backups should still be available to you on your new computer. Your new computer will continue to attach new computer files to your laptop hard drive. Keep your hard disk on permanently. (Or, if you purchased a new laptop or tablet, plug it in frequently so that your computer can keep your backups up to date.) If you just borrowed a friend's portable hard drive, you can turn it off at this point and return it. But you really should have your own portable hard drive so you can start security security security paying for your new Windows 10 pc. Your Microsoft account and File History can transfer your settings and files to your new computer. However, you still need to install all your old desktop programs on your new computer. If you're switching to Windows 10 from a computer running Windows 8 or 8.1, you can find apps waiting for you in the Windows Store: Click the icon in the upper-right corner of the Store app and choose My Library from the drop-down menus. There you can find and download your old apps to your new computer. Pc.
